Hi Scott,

I am wondering if you have a report that details results of the South Fork Tieton demographic surveys from 2018-2023. Working on BTAP updates I'd like to add a note about the key findings.

Thanks!

I don't! I've presented results at the BTWG but don't have an actual report. I should do one...

That said, I think key findings are that cutthroat are the most abundant species, followed by fairly equal amounts of bull trout and sculpin, and then whitefish. No Brook Trout were observed. Bull Trout densities are similar to Box Canyon Creek and lower than Kachess, Indian, and Deep Creeks. Cutthroat densities are similar to Box Canyon and Kachess, and greater than Indian and Deep. Sculpin densities are similar to Kachess, less than Box Canyon, and slightly greater than Deep and Indian. We have only sampled on average 3.5% of the total available habitat, so more effort is needed to use these surveys for long-term monitoring of the S.F. Tieton population.

Scott

Great,  
Thank you! I appreciate the time to quickly summarize what was found.
